Absolutely essential study pdf. It is written in basic words and phrases rather than hard to understand. I am just happy to tell you that this is basically the finest pdf I actually have studied during my personal lifestyle and can be the very best publication for actually.

This paper describes architecture and circuit approaches for the design of high-speed, low-power pipeline analog-to-digital converters in CMOS. Here the term high speed is taken to imply sampling rates above 1 Mhz. In the first section the different conversion techniques applicable in this range of sample rates is discussed. Following that the particular problems associated with power minimization in video-rate pipeline ADCs is discussed. These include optimization of capacitor sizes, design of low-voltage transmission gates, and optimization of switched capacitor gain blocks and operational amplifiers for minimum power dissipation. As an example of the application of these techniques, the design of a power-optimized 10-bit pipeline AID converter (ADC) that achieves ≈ 1.67 mW per MS/s of sampling rate from 1 MS/s to 20 MS/s is described. 2. Techniques for CMOS Video-Rate AID Conversion Analog-to-digital conversion techniques can be categorized in many ways. One convenient means of comparing techniques is to examine the number of analog clock cycles required to produce one effective output sample of the signal being quantized.
