This paper identifies the contemporaneous interactions between asset prices in U.S. financial markets by relying on the heteroskedasticity in their movements. In particular, we estimate a structural-form GARCH model that includes the short-term interest rate, the long-term interest rate, and the stock market. The results indicate that there are strong contemporaneous interactions between these variables. Accounting for this behavior is critical for interpreting daily changes in asset prices and for predicting the future paths of their variances and correlations. We demonstrate the importance of this consideration in a risk-management application.
