

Graphene nanoelectronics-moving forward

By Fan, Jincheng

Condition: New. Publisher/Verlag: LAP Lambert Academic Publishing | In 2004, Novoselov, Geim, and co-workers at the University of Manchester fabricated graphene by mechanical exfoliation. Many extraordinary properties have been reported, such as extremely high electron mobility. More important, graphene, with a monolayer of carbon atoms arranged in a two-dimensional honeycomb lattice, exhibits a variety of transport phenomena that are characteristic of 2D Dirac fermions, such as specific integer and fractional quantum Hall effects, ambipolar behavior. Graphene has been considered a promising candidate material for post-silicon electronics and likely to have the greatest impact on geometric scaling in semiconductors due to its high mobility. The nanoelectronics with graphene have been studied, widely. However, there are few books discussed graphene digital devices and radio frequency (RF) devices, comprehensively, and presented the latest advancements in these fields. the book presents the critical progress of science and technology of graphene nanoelectronics. We believe the book will bring comprehensive and valuable information on graphene nanoelectronics and help their developments. | Format: Paperback | Language/Sprache: english | 184 pp.

Reviews

Extensive guide! Its such a excellent read. This can be for anyone who statte that there was not a worth looking at. I am just effortlessly will get a satisfaction of looking at a written publication.

-- Melvin Hettinger

This book will not be effortless to start on reading through but very exciting to learn. It is amongst the most remarkable book i have got go through. Once you begin to read the book, it is extremely difficult to leave it before concluding.

-- Dr. Easton Collier DVM
