

## Arithmetical Investigations

By Haran, Shai M.J.

Condition: New. Publisher/Verlag: Springer, Berlin | Representation Theory, Orthogonal Polynomials, and Quantum Interpolations | In this volume the author further develops his philosophy of quantum interpolation between the real numbers and the p-adic numbers. The p-adic numbers contain the p-adic integers  $Z_p$  which are the inverse limit of the finite rings  $Z/p^n$ . This gives rise to a tree, and probability measures  $w$  on  $Z_p$  correspond to Markov chains on this tree. From the tree structure one obtains special basis for the Hilbert space  $L^2(Z_p, w)$ . The real analogue of the p-adic integers is the interval  $[-1, 1]$ , and a probability measure  $w$  on it gives rise to a special basis for  $L^2([-1, 1], w)$  - the orthogonal polynomials, and to a Markov chain on "finite approximations" of  $[-1, 1]$ . For special (gamma and beta) measures there is a "quantum" or "q-analogue" Markov chain, and a special basis, that within certain limits yield the real and the p-adic theories. This idea can be generalized variously. In representation theory, it is the quantum general linear group  $GL_n(q)$  that interpolates between the p-adic group  $GL_n(Z_p)$ , and between its real (and complex) analogue - the orthogonal  $O_n$  (and unitary  $U_n$ ) groups. There is a similar quantum interpolation between the real and...

### Reviews

*Good eBook and helpful one. It really is written in straightforward words and phrases and never confusing. I am just effortlessly could possibly get a enjoyment of looking at a published book.*

-- Romaine Rippin

*The book is great and fantastic. it absolutely was written very properly and beneficial. It is extremely difficult to leave it before concluding, once you begin to read the book.*

-- Lyda Davis II
