General Books LLC. Paperback. Book Condition: New. This item is printed on demand. Paperback. 96 pages. Dimensions: 9.7in. x 7.4in. x 0.2in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1910 Excerpt: . . . The diprodonts appear to have arisen in or near Australia after its separation from Asia, as none are known in Asia. A few are, however, known in what is now the region most widely separated from Australia of all land areas of the globe: viz. , South America. This relation of the fauna is better understood when taken up with the study of the South American fauna. Australia and Correlation by Stage of Evolution. Would the present Australian fauna be correlated with that of the Mesozoic of the rest of the world because entirely metatherian and prototherian No, because the stage of differentiation would be higher than that of the Mesozoic faunas of other parts of the world, and the area in which the differentiation occurred is relatively small so that one would expect less differentiation than, for example, in Arctogaea. The Recent South American fauna includes: (1) Types which were developing in South America in middle Cenozoic time, as the primate and edentate groups; (2) types which had a world-wide distribution in early Cenozoic time, as the polyprotodont marsupials; (3) diprotodont marsupials, which are possibly derived from Australia; (4) carnivores and ungulates, which are immigrants from North America. In Miocene time North America and South America contained almost no common elements in their faunas. In Pliocene time elements of each fauna suddenly appear in the other. This indicates geographic separation in the Miocene and union in the Pliocene. The stronger northern fauna replaced...
