Hemorrhage is infrequent, probably the result of extensive thrombosis. Death from exhaustion and secondary infection usually follows. The slough may separate and the patient recover, with commonly marked deformity from the cicatrization. Although more common in female children, noma may occur in either sex at any age. No specific cause for this condition has been discovered. Many forms of bacteria have been found, but the more common type found is a spirillum or spirochete, possibly Vincent s fusiform organism. Syphilitic stomatitis may occur either as the primary chancre or, what is more common, as the secondary mucous patch. The primary lesion may appear on the lip, tongue, or tonsil in either a soft or an...
