THE INHERITANCE OF FUNCTIONALLY-CAUSED MODIFICATIONS. In Part II, Chapter Xa, I have confessed that the process by which a structure changed by use or disuse affects the sperm cells or germ-cells whence arise descendants, is unimaginable: without, however, inferring that therefore such a process does not exist. With others it seems different. Some three years ago the following expression of opinion came to me from a zoological expert: --Many zoologists--most of us here at Cambridge--are intensely opposed to the doctrine of the inheritability of acquired variations. Even assuming that the developmental power of a germ is determined by its molecular structure (and I for one would question this--Driesch and his school when they find that they can squeeze a developing egg into all sorts of shapes without altering the final result, that one blastomere in an egg which has divided into 8 is still able to reproduce a whole embryo--question it also), we still fail to conceive any means by which, for instance, a change in the development of a muscle or nerve can effect a corresponding change in that part of the germ which is destined to produce a corresponding part in the descendant. Here it will be observed that belief in the inheritance of structural effects wrought by use and disuse, is rejected because of inability to conceive any means by which the modifications produced in an organ can effect a correlated modification in the germ of a descendant: failure to...
