Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1896 Excerpt: .in stringer and floor beam connections, and often an additional twenty-five or fifty per cent, for hand-driven field rivets. The required pitch of rivets in the flange angles of the floor beam is determined by the formula, p. 1, or by means of Pl. XIV, Chap. I, as the floor beam is flange of J. floor beams. nothing more than a small plate girder. In the present instance the floor beam shear between the end and stringer is constant and is $S = 64\,600 \text{ lbs.}$ $f = 3\,940$ for a rivet and plates with unit bearing stress of $12\,000 \text{ lbs. per sq. in.}$ The depth of the beam between rivet lines is $d = 45$. The required pitch can now be determined by substitution in the formula, p. 1, $f = 3940 \times 45 \times P = 2.74, 64\,600$ or, referring to Pl. XIV, running up the left hand side to the point 64.6, thence horizontally to the right to the intersection with the vertical line through the point 45. This is found to intersect the diagonal line 2.2 spacing will therefore be required between the ends of the beam and the main stringer. Between the main stringers there is no shear, except in case of unequal loading or derailment. Therefore 6 spacing f may be used. The dead load shear for the stringer is $905 \times 6.3 = 5\,600 \text{ lbs.}$ From the Riveted table for Wabash loading,...
