Forgotten Books, 2018. Paperback. Condition: New. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*. Excerpt from Optimal Consumption and Portfolio Policies When Markets Are Incomplete The first question arises from the fact that when  $M$  is strictly included in  $X$ , only the marketed commodities have their price determined by arbitrage. There is an abundance of price functionals  $\pi$  that extend  $\pi|_M$  over all of  $X$ , and one could choose a priori any one of them. However, one candidate is of special interest to us: it is the (unique) one which is measurable with respect to the price system, i.e., such that the shadow price of consumption is itself in the price information set. With this particular valuation, it turns out that a solution  $c$  to the extended maximization program can always be chosen to be price measurable. And thus marketed. To see this, we have to recall a result from option pricing theory which states that the price of any contingent claim can be written as its expectation under some probability. Let then  $Q$  be the probability associated with our choice of the price measurable valuation, and take the conditional expectation of  $c$  under  $Q$  with respect to the price information set. The new consumption plan is price measurable by construction. In addition, it can be shown that it satisfies the same budget constraint and that it is at least as preferred as  $c$ . But  $c$  is optimal by assumption, so that it should be clear that the two solutions are in fact indifferent, or even identical when the utility function is strictly concave. Thus, as far as the optimization problem is concerned, there is nothing more than the securities prices themselves that the agent needs to observe to devise his optimal strategy. Even in a world...
