

Mathematical Questions and Solutions in Continuation of the Mathematical Columns of The Educational Times Volume 54

Filesize: 8.62 MB

Reviews

These types of book is the greatest ebook readily available. I was able to comprehend every little thing using this published e pdf. I realized this pdf from my dad and i encouraged this publication to discover.

(Dr. Porter Mitchell)

MATHEMATICAL QUESTIONS AND SOLUTIONS IN CONTINUATION OF THE MATHEMATICAL COLUMNS OF THE EDUCATIONAL TIMES VOLUME 54

To download **Mathematical Questions and Solutions in Continuation of the Mathematical Columns of The Educational Times Volume 54** eBook, remember to follow the web link below and download the file or gain access to other information which are have conjunction with MATHEMATICAL QUESTIONS AND SOLUTIONS IN CONTINUATION OF THE MATHEMATICAL COLUMNS OF THE EDUCATIONAL TIMES VOLUME 54 ebook.

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1891 Excerpt: .radius vector. Any one of these curves can be drawn to have four-point contact with a given curve at any point, and, if the curve be such that the pole of the osculating spiral (S) lie always on the radius vector, the locus of S will be the inverse of the given curve with respect to the origin. If the chord of curvature through the pole be kr , it will be found that $\frac{dp}{p} = \frac{dr}{r} + \frac{d^2r}{r^2}$ (when S lies on OP), whence $r = a^2 \frac{dr}{dp}$ will be the equation for a curve such that the locus of the pole of the osculating spiral is the inverse, with respect to the circle $r = A^2$, of the curve. If the constant term in this equation be omitted, it is the equation between r and p for the spiral. Perhaps the equation would be better, written in the form $r^2 = a^2 (p/C)t + V$, since $k = 2$ (the equiangular spiral) would give $r^2 = p + A^2$, or the involute of a circle which is only a particular case. If we put $k = 2$, the osculating curve is the rectangular hyperbola, and the curve is a central conic. That is, if the rectangular hyperbola of four-point contact be drawn at each point of a central conic, the locus of its centre (the pole in this case) is the inverse of the conic with respect to the director circle. No doubt, other particular cases may be readily investigated, such as...
