Excerpt: . rising rapidly; rates of 2 m/1,000 years are common, and 1 m of local uplift during a single earthquake in 1965 is documented. New Ireland is violently seismic, but vertical uplift of midPleistocene reef terraces is slight, and the Holocene dates are similar to many others. Tonga is also a seismic region, but Holocene emerged reefs were found only on Tongatapu and Eua. Other islands in Tonga have been stable or possibly subsided in the Holocene. The array of data points, ranging from +12 m to-8 m in the last 7,500 years, should convince us that local tectonic history is the primary factor 11980. in Marnier. Nils-Ajtcl, ed, Earth Rheology. Isotuy and Eustuy: New York. John Wiley, p. 606-618. INTRODUCTION The coral-reef zone of the South Pacific has been the focus for a continuing controversy about Holocene sea levels (see Russell, 1961) with current opinions no longer polarized into two or three schools of thought but spread across the full range of possibilities. Because the controversy about Holocene sea-level change concerns a vertical range of no more than 3 m from present sea level, the resolution is easily confused by shorezone deposits of storm and tsunami debris, especially on coral coasts. Local tectonic movements in island arcs are also likely to confound the record, as are possible changes in tidal amplitudes or geoid perturbations caused by as yet unknown processes deep within the Earth (Morner, 1976). A constructive new approach to Holocene sealevel studies in the...
