II. It is shown (Calculus of Variations, p. 262) that the value of  $z$  which, for certain assigned limits, renders the double integral  $y(Dzy (Dyzydx dy Zdx dy$  a maximum or a minimum, is given by the partial differential equation Similarly it may be proved that the form of the function  $w$  which, for certain assigned limits, renders the symmetrical multiple integral . . .  $y(Dxwf (Dvwf (Dzuy. . . dx dy dz. . . or . . . Wdx dy dz. . . a maximum or a minimum, is given by the partial differential equation If there be but three independent variables  $x, y, z$ , the advanced student will find no difficulty in verifying the following theorem: --If  $S$  be a closed surface enclosing a continuous mass, the density at each point of which is constant, and  $F$  the resultant attraction of an external system  $M$  at any element  $dm$  within  $S$ , then in order that the value of the triple integral  $JjJ-Ft fm$  taken throughout the space included within  $S$ , should be a maximum or a minimum, the distribution of  $M$  should be such that  $DXA DSB D.
