Excerpt from **An Annotated Bibliography on Detached Breakwaters and Artificial Headlands** In recent years there has been a growing awareness of the potential use of detached breakwaters for shore stabilization. However, lack of design experience with these structures has hindered their widespread application in beach erosion projects. Engineers are often uncertain about how to approach the design problem because of the many unknowns involved. In addition, there are few existing structures that can be studied to provide prototype data. This annotated bibliography is presented to assist in the development of reliable design procedures for detached breakwaters. The references deal with topics which can be usefully applied to the design problem although many are not limited solely to the subject of detached breakwaters. For instance, the wave dissipation characteristics of submerged breakwaters are discussed in several papers. An understanding of these characteristics would be necessary for the design of some detached breakwaters. Papers on wave diffraction, reflection, transmission, and overtopping are also included. The bibliography is not comprehensive in these areas but an attempt has been made to identify some significant works with potential applications. Several papers describe the use of detached breakwaters as sand traps for navigation projects. Although this use does not fall within the realm of shore protection, these structures do affect the coastal processes in the same way as shore protection breakwaters.
